

Fermax IP DP

SIP based VoIP video door phone panel

Fermax PBX EXP

Fermax PBX KEY

Fermax PBX EA

User and installation guide

Welcome

Congratulations on purchasing the door phone panel **Fermax IP DP** “VoIP Door Phone”, which is a SIP based VoIP version of “**Fermax PBX DP**” analog door phone panel. This door phone can satisfy your need of communication with visitors at the entrance to the building, to your company or at the entrance of your house. VoIP means “**Voice over Internet Protocol**” – the door phone is connected to the computer network and enables both P2P (peer to peer) connection – i.e. it calls to an IP address of other VoIP device directly or it is registered to a SIP server, then it calls a phone number. There can be assigned up to two 25 digit numbers including characters “*”, “#”.

The basic module of the door phone always contains 2 pushbuttons and optionally the first expansion, 8 pushbutton C module. The combination of Fermax New Cityline panels enable the sets of door phone with **1 to 10 pushbuttons** just by using the basic electronics module of **Fermax IP DP**. You can also expand the whole system by the 8 pushbutton expansion module **Fermax PBX EXP** up to the limit of **64 pushbuttons**. The basic module can contain a colour camera, optionally there can be an add-on speaker module with an amplifier **Fermax PBX EA**, which is used for very noisy areas. The Fermax New Cityline panels are rich with an add ons. For example the panels offer installations on the surface or flush mounted, they can be used both indoors and outdoors, there can be add-on roofing used, etc.

The Fermax IP DP door phone panel is powered by 12V of the power supply, which can also be used for powering the electrical lock of the door. The Fermax IP DP is also PoE powered (Power over Ethernet). The features of the door phone are similar to a hands-free telephone. Among basic features you can find the possibility of opening up to two doors via connected electrical locks and also an easy WEB based programming.

The producer improves the SW (firmware) of the door phone panel continuously. Fermax IP DP panel enables uploading the latest firmware version via a standard PC. The latest firmware can be downloaded at <http://www.alphatech.cz/ipdp-firmware/firmware.htm>.

All necessary steps for this process can be found on page 30. We strongly recommend using the latest firmware version, which brings new features and solves various possible issues of the continuously improving Fermax door phone panel. At www.alphatech.cz you can also find the latest version of user and installation guide.

1 **Basic description**

1.1 **Features**

- IP (SIP) modular system with built-in colour camera
- P2P or SIP proxy mode (PBX network system)
- 1-64 pushbuttons
- Two 25-digit numbers on each pushbutton
- Waterproof pushbuttons with impregnation IP66, gold plated contacts
- Pushbuttons are manufactured in zamak and a natural chromed finish
- Panel is made of highly weather resistant anodized aluminium
- Easy installation for outdoor or indoor use
- Permanent card slot lighting
- Card slot lighting by low consumption, max. duration LEDs
- 2 relays for two independent electrical locks
- Codelock feature by using pushbuttons
- Up to six codelock numerical passwords (2-6 digits)
- Basic panel set is supplied in 2 pushbutton version with colour camera and surface mount installation box (ref. 1CP201 + ref. F7061)
- Basic panel ref. 1CP201 contains the first expansion module for 8 pushbuttons
- Power supply 12V or PoE (Power over Ethernet)
- PoE allows using a low consumption el. lock
- PopUp SW for on-line monitoring of door entrance, possibility to open el. locks via PC
- WEB based programming
- Integrated heating of the electronic circuit board
- OS Linux 2.6
- USB connection of integrated camera – USB Guest 1.1
- Software GSPCA for video transmission to web browser in PC – W3CAM (J-PEG, RTSP stream) and stream H.263
- Flush or surface mounting
- Automatic illumination for camera by white LEDs

1.2 Used terminology

- **Ethernet** is a family of frame-based computer networking technologies for local area networks (LANs)
- **LAN** - a local area network (LAN) is a computer network covering a small physical area, like a home, office, or small groups of buildings, such as a school, or an airport
- **10Base-T** – 10 Mbit/s, it uses 8 position modular connectors, usually called RJ45 in the context of Ethernet over twisted pair. The cables usually used are four-pair twisted pair cable (though 10BASE-T and 100BASE-TX only actually require two of the pairs). Each of the standards support both full-duplex and half-duplex communication. According to the standards, they all operate over distances of up to 100 meters
- **100Base-TX** – so called **Fast Ethernet**, two pairs of UTP or STP cable, category 5
- **Twisted pair** cabling is a type of wiring in which two conductors (the forward and return conductors of a single circuit) are twisted together for the purposes of canceling out electromagnetic interference (EMI) from external sources; for instance, electromagnetic radiation from unshielded twisted pair (UTP) cables, and crosstalk between neighboring pairs
- **UTP**, Unshielded Twisted Pair
- **STP**, Shielded Twisted Pair – the cabling includes metal shielding over each individual pair of copper wires. This type of shielding protects cable from external EMI (electromagnetic interferences)
- **WEB** - World Wide Web (WWW, or **web**) – a world-wide application of HTTP internet protocol
- **HTTP** (Hypertext Transfer Protocol) is an internet protocol used originally for exchanging hypertext documents in HTML format
- **USB** (Universal Serial Bus) – modern way of connecting external devices to the computer
- **Video codec** („coder and decoder“) - compression **H.263** is derived from MPEG-4, **H.264** is a coder for MPEG-4 AVC format. **MPEG-4** is a type of video compression – decreasing of data stream video sequence
- **JPEG** is a standard method of loss compression used for saving digital images
- **Voice over Internet Protocol (VoIP)** is a technology enabling transmission of digitalized voice inside the packej of protocols family **UDP/TCP/IP** via komputer network. I tis used for making phone calls via Internet, Intranet or any other kind of data connection
- **TCP/IP** contains a set of protocols for communication in the computer network and it is the main protocol of Internet
- **IP address** is a number, which clearly identifies a network interface in the computer network, which uses IP protocol
- **DHCP** (Dynamic Host Configuration Protocol) is an application protocol from the family of TCP/IP. It is used for automatic assigning of IP addresses to individual personal computers in the PC networks, thus simplifying their administration
- **Internet** is a word-wide system of mutually connected computer networks
- **Intranet** is a computer network similar to Internet, but it is a private one. That means it is just used for small user groups (e.g. employees of a company)
- **PoE** (Power over Ethernet) is powering via data network cable, with no need of bringing the power supply via a separate cable
- **NTP** (*Network Time Protocol*) is a protocol for synchronization of internal computer clock

1.3 Assembly of panels

The building blocks of Fermax IP DP are the basic panels which differ by its size, number of pushbuttons, if the visit card has got two or one pushbuttons.

1.3.1 Terminology and orientation in panels

4 CP 204 (item number) as a representative of terminology. It is a panel with height of 199mm. It contains an audio module, a colour camera and two times 4 pushbuttons, i.e. 8 pushbuttons in total.

first digit: 1 - 9 defines **the height** of the whole panel, the width of all panels is 130mm.

1 - 128mm

2 - 151mm

3 - 175mm

4 - 199mm

5 - 246mm

6 - 294mm

7 - 341mm

8 - 389mm

9 - 436mm

group of letters: defines basic HW features of panel :

A - audio panel

C - audio panel with a camera

P – panel with pushbuttons

V – panel with a window

W- panel with two windows

first digit after letters: **1 / 2** – defines number of pushbuttons at visit card
1 (on the right) or 2 (on the left or right)

next two digits: **01 - 15** – number of visit cards. If multiplied by the previous digit, then we get a number of pushbuttons on the panel

By this marking one compact panel is defined. The panel can be expanded by other panels vertically or more optimally, in a horizontal direction. In case of horizontal expansion, then it is necessary to use the same height of panels (defined by the first digit of the item number).

1.3.2 Examples of panels

2 CP 102

All panels can be mounted either on the surface or they can be flush mounted. In the latest catalogue of Fermax you can choose the correct New Cityline accessories incl. for example the protective roofing.

Fermax IP DP panels can be equipped with an additional time switch called "**TimeRelay**". It is used for an expansion of the number of switches. It is programmable. Based on switching of one of the two switches in the Fermax IP DP panel, the TimeRelay can simulate e.g. sequent opening of the door or alternatively you can connect the exit button.

1.4 Characteristics of the modules

1.4.1 The basic module of electronics Fermax PBX DP

The basic module of Fermax IP DP panel is supplied in two versions – with two pushbuttons - Fermax IP DP-2 (a version for 1 or 2 pushbuttons) and two pushbuttons with a possibility of expansion by additional 8 pushbuttons, i.e. each basic panel allows connection of up to 10 pushbuttons with no further accessories of Fermax IP DP panel. The basic module can be further expanded by additional 8 pushbuttons via modules called Fermax PBX DP EXP and a keypad module called Fermax PBX KEY.

Picture 1 Schematics of connection and set-up elements

Picture 2 The real image of connection and set-up elements

1. **PoE module** – the Fermax IP DP panel is equipped by a circuit supplying the power over UTP cable – PoE. If your network switch is equipped by PoE, or if you have got a PoE power supply (a box in the size of a power supply adapter inserted into the input of the UTP cable), then for the correct function of the door phone panel you do not need an external power supply of 12V. If you use an electrical lock for opening the door, then you need to use an external power supply adapter (only in the circuit with relay contacts). You can also use a lower power consumption electrical lock. In this case please use the connector on IPNCmod 12V. When the door phone panel is PoE powered, there is 12V/350mA available.
2. **Yellow LED** – signalling of active power supply
3. **Yellow LED** – data activity on the network connection (continuous light during data transmission)
4. **Green LED** – network connection (Ethernet) – continuous light in case the UTP cable is connected correctly.
5. Loudspeaker loudness **SPK** – by the trimmer you can set a desired loudness of the loudspeaker. In case you need to further increase the

power output of the loudspeaker, you can use an add-on module with an amplifier Fermax PBX EA.

6. Loudspeaker connection **SPK**
7. Microphone connection **MIC** - attention on the right polarity!!!
8. **MIC** loudness setting – by the trimmer you set the desired level of loudness of the microphone.
9. Settings of **Echo** cancellation. Fermax IP DP door phone panel is a hands-free telephone. During the phone call the signal from a loudspeaker comes back to the microphone and it comes with a delay to the calling party (that is caused by a digital conversion and transmission of the signal). For this reason the door phone panel is equipped by an echo cancellation circuit. It is necessary to pay more attention during the setting of the echo cancellation circuit. The right setting of echo cancellation means at what level of sound the mic turns off in Fermax IP DP in order to avoid returning the delayed sound.
10. Setting of **sensor sensitivity** on surrounding light. It is valid only for modules equipped with a camera. If case the surrounding light decreases below at certain level (it is set by this trimmer), then the camera is equipped by a white LED diodes for extra illumination. These LEDs are activated during a phone call only.
11. **Green LED** – it signals an outgoing call (the door phone panel calls the destination number or IP address)
12. **Yellow LED** – it signals an incoming call (there is a call coming to the door phone)
13. **Ethernet** connection (UTP cable) – a connection to the computer network. If you have got a network switch with PoE or a PoE power supply (a box in the size of a power supply adapter inserted to the input of UTP cable), then you do not need an extra power supply for operation of the door phone panel.
14. **DIP switch** – setting of default values and the mode of Fermax IP DP door phone via a DIP switch.
 - 1- reserve (unused)
 - 2- mode switching P2P / SIP server
 - 3- basic settings – resets all values to factory settings except for the memory of numbers
 - 4- sets the starting IP address to 192.168.1.250All changes show always after turning off and turning on of the power supply (restart).

The DIP switch 3 and 4 needs to be switched back to „on“ position after the start of VoIP module. Otherwise after the restart the set parameters or the new IP address are rewritten back to the default mode.
15. **Output of 12VDC** (max. 350mA!). This output is used primarily for supplying the power to the lowconsumption electrical lock when PoE is used.

16. Switching **contact 2** (NO= normally open, NC= normally closed and COM= common output of the switch).
17. **Connector 8** – for connecting 8 pushbuttons (integrated expansion). For connection please use an interconnection cable **Fermax PBX CC8**. Each colour of the cable is assigned exactly for a specific pushbutton – see picture 3.

Connection of pushbuttons:

- blue = 3rd pushbutton
- brown = 4th pushbutton
- yellow = 5th pushbutton
- red = 6th pushbutton
- white = 7th pushbutton
- green = 8th pushbutton
- orange = 9th pushbutton
- black = 10th pushbutton

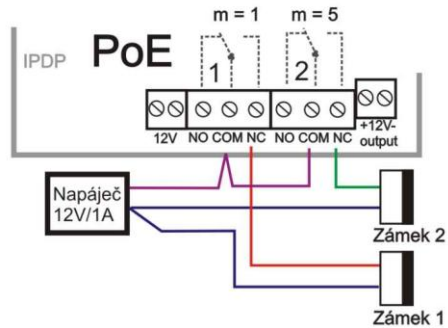

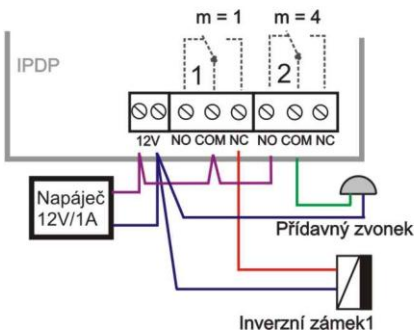

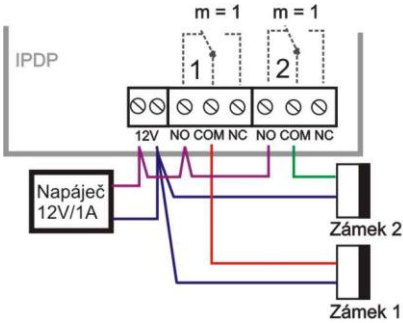

Picture 3 Cable Fermax PBX CC8

The numbers of pushbuttons begin with 3, because the first two buttons are integrated on the basic panel.

18. **Connector 5** – connection of the 8-pushbutton expansion **Fermax PBX EXP** or the keypad **Fermax PBX KEY**. The connection is done via **Fermax PBX CC5** cable. It is a data connection only. Power supply of illumination and the common output is on the **Connector 3**.
19. **Connector 3** – it is used for connection of the power supply and the common output of the pushbuttons. The original Fermax cable is used (Fermax PBX CC3).
20. Jumper Light enables switching on/off the illumination of visit cards.
21. Switching contact of the **2nd switch** (NO=normally open, NC=normally closed and COM=common output of the switch).
22. When using Fermax IP DP, it is suggested to use either an alternating power supply voltage min. 10VAC – max. 15VAC or a direct power supply voltage min. 12VDC - max. - 18VDC. which is connected to the connector "12V". The load of the power supply depends on the number of modules used, because it is used also for powering the illumination of visit cards – if the max. number of pushbutton panels is used, the power consumption does not go beyond 500mA. This power supply can be also used for powering the electrical locks, then you need to calculate also with the power consumption of electrical locks. Usually it is enough to use a power supply of 12VAC/1A÷2A.

1.4.2

Example of switches connection

The switching contact of relay is separated galvanically from other circuits of the door phone panel.

When using PoE, the output of 12V is connected galvanically with the PC network. Therefore when using PoE power supply, please pay attention during manipulation and installation. The circuit is connected galvanically with the computer network!!!

1.4.3 Front panel

1. Assembly openings for mounting of the front panel. After installation of the top opening, please cover it with the plastic cover with Fermox logo. When bottom opening please cover with the grey, round plastic cover. Both covers incl. the screws are part of delivery as accessories.
2. Loudspeaker.
3. Camera with illumination and a sensor for switching on the illumination.
4. Pushbuttons. These two

- pushbuttons can be found on the basic electronics module (the main PCB). In case you use a panel without these first two pushbuttons, then please leave them out during the programming process (pushbuttons 1 and 2).
5. Visit card. The exchange of visit card is described later on in the manual. The visit card is illuminated by white LEDs (they can be switched off). You can also find a red LED under the visit card – it is used for signalling of the door phone panel status.
 6. Microphone.

1.4.4 Exchange of visit cards

The visit cards are disassembled from the front of the door phone panel as shown on the picture. Please use a tool carefully, do not damage the front panel or the cover of visit cards. The cover of visit cards is a tub into which you place the paper with description (the visit card).

1.4.5 Camera

The module of colour camera is integrated into the panel of Fermax by a sub-board with mounted LED illumination and a sensor of surrounding light.

1. Camera module
2. The main board of the camera - 3 LEDs for illumination
3. Mounting column for the main board
4. Sensor of surrounding illumination
5. Mounting of the main board

1.4.6 Expansion module Fermax PBX EXP

The expansion module has got two connectors 5, one is used for connection towards the basic module (Fermax PBX DP) and the second one is used for connection of the following module. For interconnection please use cable **Fermax PBX CC5**. Besides connectors 5, you can also find on the expansion module the connector 8 for connection of the pushbuttons. For interconnection please use the cable **Fermax PBX CC8**. Each colour of the cable is assigned exactly to the specific pushbutton, see picture for more details.

Picture 4 Cable Fermax PBX CC8

Connection of pushbuttons:

| Colour of wire | Position number on Fermax PBX EXP | | | | | | |
|----------------|-----------------------------------|----|----|----|----|----|----|
| | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Blue | 11 | 19 | 27 | 35 | 43 | 51 | 59 |
| Brown | 12 | 20 | 28 | 36 | 44 | 52 | 60 |
| Yellow | 13 | 21 | 29 | 37 | 45 | 53 | 61 |
| Red | 14 | 22 | 30 | 38 | 46 | 54 | 62 |
| White | 15 | 23 | 31 | 39 | 47 | 55 | 63 |
| Green | 16 | 24 | 32 | 40 | 48 | 56 | 64 |
| Orange | 17 | 25 | 33 | 41 | 49 | 57 | |
| Black | 18 | 26 | 34 | 42 | 50 | 58 | |

The numbering of positions is shown on the picture 5. All numbers of pushbuttons refer to the settings of the door phone panel (see more in the programming section).

Picture 5 Connection of expansion modules

1.4.7 Keypad module Fermax PBX KEY

The keypad module is connected via a cable Fermax PBX CC5 and a cable Fermax PBX CC3. The connection is similar to the connection of the expansion module. The difference is that the keypad module is always the last in the row (you cannot connect to the keypad module any other module). The keypad module can be only connected to the second position (i.e. directly to the basic module) or to the third position (to the output of the first Fermax PBX EXP module). **Attention – 1st position can't be used because the first position is occupied by the fixed expansion on the basic module (pushbuttons 3-10).** This means that besides the keypad you can use 0 – 18 pushbuttons with the direct dialling (depends on the specific configuration).

Please pay attention during programming – you need to specify correctly to which position the keypad is connected.

Dialling is realised by a sequent pushing of number pushbuttons. When entering a password, you need to press the **B** pushbutton. To hang up, please press the pushbutton **A** and the door phone panel hangs up.

1.4.8 Other modules (panels)

All other panels can be found in the offer of your local partner.

1.5 Assembly of the door phone panel

1.5.1 Surface mounting

For surface mounting we offer a compact installation box. The installation box is mounted with screws with plugs to the wall. On the picture you can find an installation box, size 1.

1.5.2 Flush mounting

Flush mounted installation boxes are referred to as “MKxx” or simply “flush mount installation boxes”. When using the nearly square flush mount installation box MK1, please pay attention on the correct orientation of the mounting holes – they need to be on the vertical axis. The correctly mounted installation box is shown on the picture.

1. Preparing installation box
2. Principle of connecting installation boxes next to each other

3. Placing the installation box above the ground

2 DoorPhone VoIP Operation

2.1 Signaling Overview

The all-purpose guard signals an acoustic conditions they may occur during operation. Another signaling can be done by means of red LED (placed under first label).

| Condition | Tones | Tone frequency | LED |
|---------------------------------|-------|------------------|----------|
| Line lifting up | | 425-850-1275 | glows |
| Line hanging up | | 1275-850-425 | goes out |
| Report after calling | | 425-850-1275 | glows |
| Notice about call end | | 1275 | glows |
| Parameter confirmation | | | glows |
| Switch on (Reset) | | 1275-850-1275 | blinks |
| Error (anything, if unsuitable) | | 425.... | |
| Empty memory (no progr. numb.) | | 850-1275-1700... | |

2.2 Visitor at Door

The all-purpose guard function is influenced partly by used guard assembly (with keyboard or without it) and partly by setting of guard parameters.

2.2.1 DoorPhone without Keyboard

The DoorPhone **buttons** are provided by nameplates or positions of persons inside the object. The incoming person will press the corresponding button, the DoorPhone will lift up the VoIP canale neither immediately (the button is not the first number from code lock), or with delay and dial the programmed phone number thru VoIP, but dial number differs by choice mode, which is set in the DoorPhone :

- **Day/night** mode = being the DoorPhone in Day mode, so it is always dialing a number set in table 1, in Night mode, it is always dialing a number set in table 2.
- mode **two number group** = first press – it always dials a number set in table 1. By repeated press of the same button or detection of busy tone after dialing the DoorPhone will select the number from the second group (*table 2*). The next press of the same button again selects a number of the first group, etc.....

The switch (**code lock**) can be controlled by first 10 buttons of DoorPhone. If the visitor at door presses buttons in such combination that meet the preprogrammed code and the time among presses is not bigger than the

set point, then the DoorPhone will pick up and close the corresponding switch (if set in m=1 or m=5 modes) to the period given by setting in parameters. Then it will hang up.

2.2.2 DoorPhone with Keyboard

The DoorPhone with keyboard can also include besides the keyboard up to 16 buttons of direct dialing always behaving as to be mentioned in 1.4.7(page 16) except the code lock. This one is always situated on keyboard. After keyboard is connected, the position, where the keyboard is connected to, should be set in programming parameter.

The keyboard has two functional buttons – **B symbol** = once pressing the numerical combination is considered as the combination for control of the switches. The second button – **A symbol** = when pressing the DoorPhone immediately will hang up.

The number selection on keyboard can be executed in two ways:

- The incoming person is dialing number as to be done on phone – the period among button presses should be lower than the value given by programming *parameter*. After this period the DoorPhone will lift up and dial the given number.
- On buttons the incoming person is dialing a two-digit number (from 01 to 64), which represents the memory number, where the 16-digit number is stored (same as for buttons). The number dialing is managed by Day/Night setting or mode for two groups of numbers (as described in chapter 2.2.1 page 18).

2.3 Person Inside Object

The person inside object is considered a person that is in phone contact with DoorPhone.

2.3.1 Outgoing Call

The outgoing call is the call from DoorPhone (caused by visitor). After guard choice the telephone is ringing inside object and the pick-up will allow speaking to the visitor at door. The code choice can close the switch, if set to m=1 or m=5 modes, change over the Day/Night modes and hang up the DoorPhone. The DoorPhone in 10 seconds before call end will send a notice about call end and the call may be extended by sign selection (* or #). The telephone hanging up will end the call.

They are two possible means transmission information of push buttons (command for opening lock, switch-over day/night, prolongation conversation, command for hang-up) - by either in "RTP channels" or in "SIP info", variant "inband DTMF" isn't in IPDP decoding.

2.3.2 Incoming Call

The incoming call is the call to the DoorPhone (caused by person inside object). After exchange number selection, where the DoorPhone is connected, the DoorPhone is ringing and when set number of rings is over, the DoorPhone will pick up and it is possible to speak. The possibilities are the same as with outgoing call.

3 Programming of Parameters

3.1 Basic VoIP settings

3.1.1 Choosing a mode and login

It is important to choose a DoorPhone mode first. The DoorPhone can work in the PeerToPeer mode or SIP server mode. The mode setting can be made by a relevant switch (DIP switch see on Pict. 9). In the SIP server mode is possible to choose SIP server (external). It can be set in a configuration interface of the DoorPhone.

Setting values in doorphone to the firm setting make by DIP switch 3 move to the position off and reboot doorphone. After reboot system this switch is necessary return to the position On.

Setting of basic IP address 192.168.1.250 make by DIP switch 4 move to the position off and reboot doorphone. After reboot system this switch is necessary return to the position On.

Pict. 1 DIP switch setting

Reboot doorphone it is possible make by double ways – partly turn it off and on again, or clicks on „Restart“, in WEB site is at the entry service.

IP address of doorphone is from the manufacturer (as well as default) setting on 192.168.1.250. If you are at installation in other numbering nets (= NOT BEGINING 192.168.1.xxx) so is necessary setting in feature of protocol TCP/IP in your PC IP address either temporarily or like alternative configuration e.g . 192.168.1.245 . Then it is possible setting parameters of doorphone including new IP address and after reboot VoIP module in doorphone you can attach to WEB sites of the doorphone already on new IP address.

ATTENTION: DIP switch 3 and 4 must be in position "On", otherwise new IP address after reboot module is re-write back on starting IP address = 192.168.1.250.

In your web browser enter IP address of the DoorPhone, default is 192.168.1.250. See Pict. 2.

Pict. 3 Login to setup

3.1.2 Language option

Language setting can be made in a menu on the left panel.

The screenshot shows the 'Network setting' interface. On the left, there is a 'Menu:' section with a list of options: Network setting, Basic parameters, Setting audio, Setting video, Relays, Time parameters, Memory numbers, Service, Video, and Help. Below the menu is a 'Language:' section with a dropdown menu currently showing 'english' and a 'Set' button. The dropdown menu is open, showing options: english (selected with a red checkmark), Français, english, and Čeština. The main area is titled 'Network setting:' and contains several input fields: Hostname (empty), Setup via DHCP (checkbox, unchecked), DHCP client ID (text box with 'udv_guard'), IP address (text box with '192.168.1.250'), Network mask (text box with '255.255.0.0'), Default gateway (empty), Primary DNS server (empty), and Secondary DNS server (empty). At the bottom are two buttons: 'default values' and 'save and restart'.

3.1.3 Network settings

Network settings are located in the **Network setting** menu item. It is possible to use DHCP service (1) or you can enter IP addresses manually.

Manual configuration:

This screenshot is similar to the previous one but includes red annotations. A circled '4' is next to 'Day mode'. A red checkmark is next to 'Network setting' in the menu. A circled '5' and '6' have arrows pointing to 'Video' and 'Help' respectively. In the main settings area, a circled '1' is next to the Hostname field, a circled '2' is next to the 'Setup via DHCP' checkbox, a circled '3' is next to the 'DHCP client ID' field, and red checkmarks are next to the 'IP address' and 'Network mask' fields. A circled '7' is next to the 'save and restart' button.

After making changes click on a **save and restart** button.

1. Hostname – name of doorphone for resolution in nets (e.g . while using more doorphones – more entrance)
2. Enable/disable ethernet settings via DHCP

3. Setting IP address, mask, eventually next network parameters, in case of obscurity contact his IT manager
4. Display actual mode of IPDP – day / night
5. Return on introductory WEB site with display videos from cameras IPDP
6. short help for quick assistance in setting the parameters1 –
7. Default value – presettings to the firm settings. After making changes click on a save and restart button (display screen - see page 29).

DHCP configuration:

| | |
|---|---|
| <p style="text-align: center;">Day mode</p> <p>Menu:</p> <ul style="list-style-type: none"> • Network setting ✓ • Basic parameters • Setting audio • Setting video • Relays • Time parameters • Memory numbers • Service • Video • Help <p>Language:</p> <p>english <input type="button" value="Set"/></p> | <p style="text-align: center;">Network setting:</p> <p>Hostname: <input type="text" value="Door1"/> ①</p> <p>Setup via DHCP: <input checked="" type="checkbox"/> ②</p> <p>DHCP client ID: <input type="text" value="udv_guard"/> ③</p> <p>IP address: <input type="text" value="192.168.1.44"/></p> <p>Network mask: <input type="text" value="255.255.255.0"/></p> <p>Default gateway: <input type="text" value="192.168.1.200"/> ④</p> <p>Primary DNS server: <input type="text" value="78.41.19.2"/></p> <p>Secondary DNS server: <input type="text" value="78.41.19.3"/></p> <p style="text-align: center;">⑤</p> <p style="text-align: center;"><input type="button" value="default values"/> <input type="button" value="save and restart"/></p> |
|---|---|

After making changes click on a **save and restart** button.

1. Hostname – name of doorphone for resolution in nets (e.g . while using more doorphones – more entrance)
2. Enable/disable ethernet settings via DHCP
3. DHCP client ID is name, which using for assigning two IP address to only thing the MAC address (in IPDP porter has meaning as far as will be including internal SIP server)
4. display parameters automatically assign by DHCP - IP address and next setting
5. Default value – presettings to the firm settings. After making changes click on a save and restart button (display screen - see page 29).

Important: if you use setup via DHCP, then it's assigning IP address to DoorPhone automatically and network administrator must tell you actual address, to was possibility display video in web browser. Because assigning IP adress can change after e.g . failure power supply in object, so they recommended enjoy DoorPhone with fixed IP address.

3.1.4 Peer to peer or SIP server connection

The DoorPhone can be set to the peer to peer (P2P) mode or to the SIP server mode by DIP switch (page 21). In P2P mode DoorPhone calling IP address – in memory buttons (page 35).

If you setting SIP server mode by DIP switch, so add in menu item SIP parameters

Day mode

Menu:

- Network setting
- Basic parameters
- **SIP parameters** ✓
- Setting audio
- Setting video
- Relays
- Time parameters
- Memory numbers
- Service
- Video
- Help

Language: english [Set]

SIP parameters:

SIP proxy server Address: ①

Port:

Account module Name: ②

Password:

Expiration [sec]: ③

④

After making changes use the **save changes** button.

1. SIP proxy server IP address or the SIP server name and port (usually 5060 or 5061)
2. Registering data to SIP proxy server (aren't obligatory)
3. Expiration is interval of sending requests for re--registration in SIP server
4. Default value – presets to the firm settings. After making changes use the save changes button.

3.1.5 Audio codec setting

Day mode

Menu:

- Network setting
- Basic parameters
- **Setting audio** ✓
- Setting video
- Relays
- Time parameters
- Memory numbers
- Service
- Video
- Help

Language: english [Set]

Setting audio:

Priority 1:

Priority 2: ①

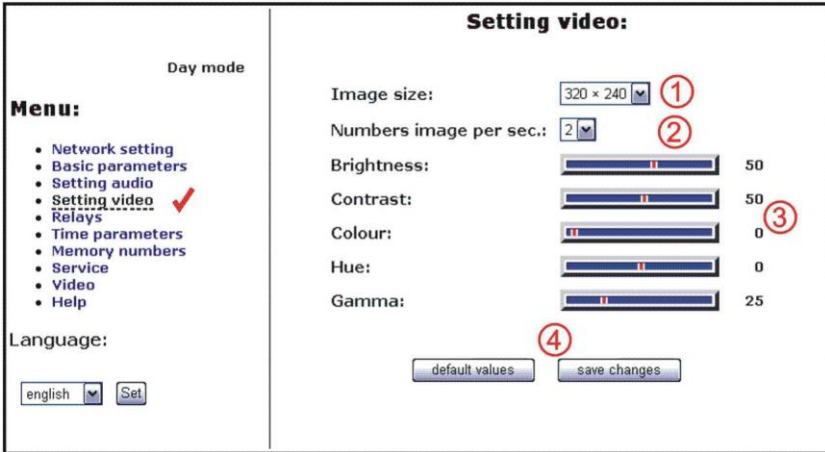

Priority 3:

Priority 4: ②

After making changes use the **save changes** button.

1. There is choosing only priority using audio codecs, used codec is selection automatically at make audio connection in SIP protocol.
2. Default value – presettings to the firm settings. After making changes use the save changes button.

3.1.6 Setting video

After making changes use the **save changes** button.

1. Resolution display video
2. Number picture per second (frequency restoring picture)
3. Setting next parameters of camera
4. Default value – presettings to the firm settings. After making changes use the save changes button.

3.1.7 Viewing the video (programme PopUp)

Video in doorphone IPDP is capture by USB WEB camera. Picture from camera is sending partly like series JPEG pictures to the environment WEB browser (first page on IP address IPDP doorphone) and second method is, that IPDP sending stream video in coding H.263 and in future H.264. This stream video is possible watch e.g . on telephone Grandstream series GXV3000, which has big LCD display.

Next interesting way watching videos from IPDP is install PopUp program UDVGUARD for Windows. This programme also with manual is freely download on http://www.alphatech.cz/engl/e_ipdp.htm. Programme except display the video has even this interesting functions:

- at conversation IPDP is program automatically activate from system tray of Windows to the foreground and display picture from IPDP, after termination talk again minimalize (function PopUp)
- makes it possible switch on by click both relay in IPDP – opening door
- makes it possible acoustic connection with IPDP – if doorphone call on address PC with installed and running programme, so it is possible receive conversation from IPDP through the medium sound card in PC. Click on button DoorPhone in program it is possible reversely call to IPDP
- programme it is possible install to the max.100 computers in net, if is active connection with IPDP, so to all computers with running program maximize window with displayed video. In programme is adjust IP address of doorphone, thereby it is possible in one nets operate more Slim IPDP and to which IPDP programme is coresponded individual "Hostname" setting to page.23 and this Hostname is displays in header of programme PopUp.

Parameters of video is on page 36

3.1.8 Day intervals

Day mode

Menu:

- Network setting
- Basic parameters
- Setting audio
- Setting video
- Relays
- Time parameters
- Memory numbers
- **Day Intervals** ✓
- User interface
- Service
- Video
- Help

Language: english Set

Day Intervals: 1 16:12

| | Interval 1 | Interval 2 | Interval 3 |
|------|------------|------------|------------|
| Sun: | | | |
| Mon: | | | |
| Tue: | | | |
| Wed: | | | |
| Thu: | | | |
| Fri: | | | |
| Sat: | | | |

Empty day line is considered as full day.
All outside entered intervals in one day is considered as night.

default values save changes 3

After making changes use the **save changes** button.

1. Display actual internal time (you must setting in "Service" time server)
2. Table of time interval - interval is meaning where is day, the rest is night. For example: interval 1 = 08:00-12:00, interval 2 = 14:00-17:00 - from 00:00 to 7:59 is night, from 8:00 to 12:00 is day, from 12:01 to 13:59 is night, from 14:00 to 17:00 is day and from 17:01 to 23:59 is night.
3. Default value – presettings to the firm settings. After making changes use the save changes button.

3.1.9 User interface

Day mode

1. display current version of firmware in module VoIP and in module doorphone. Button "Basic LOG" or "Extended LOG" displays to the what state LOG switch, it means you see "Extended LOG" so they switch to the

basic LOG and back to, in short switch you have such LOG, which don't see writing on button.

2. Click on "Download log file" file save to you choice place. File has extension ".BIN", this is necessary rename on ".TAR". To unpacking archive "tar" use e.g . programme "[PowerArchiver](#)". File from file equip extension ".TXT". Last notice is thereon, that the text file hasn't standard ending rows. To safe display get past e.g . programme "[PSPad](#)".
3. Click on "Show call log" will display history of call for SIP - only call instructions.
4. Click on "Show VoIP log" start VoIP monitor - log file which is running in new browser window - online displays events.
5. Time server is IP adress of NTP server with time data (actual time in module VoIP is displayed in "Day intervals")
6. Syslog server is IP adress of computer where is running syslog aplication for collection network events
7. tool for upgrade firmware in module VoIP and in module doorphone, switching automatic - information is in upload fille. Next in this tool is possible change environment of WEB sites - colours, fonts, frames...
8. Addition / change language file - upload fille with language assignment
9. Save configuration - save actual setting in IPDP (all features)
- 10.Restore configuration - restores setting of all IPDP from file previously storage configuration
- 11.Change access password, default is 1234
- 12.Reboot VoIP module.

3.2 Setting DoorPhone parameters

3.2.1 Basic Parameters

Day mode

Menu:

- Network setting
- **Basic parameters** ✓
- Setting audio
- Setting video
- Relays
- Time parameters
- Memory numbers
- Day Intervals
- User interface
- Service
- Video
- Help

Language:

english

Basic parameters:

Mode of choice numbers:

Day-Night (1)

2 group of numbers (3)

Prolongation char:

* - star (2)

- hash

Hang up phone:

Code for hang up phone 1: (3)

Code for hang up phone 2:

Switching between Day Night:

Night:

Manually (5)

Automatic (6)

Mode of keyboard:

Direct choice number (phone) (6)

Choice of number from memory

Code of switching: (4)

Code for switching Day:

Code for switching Night:

Keyboard to position: (7)

(8)

After making changes use the **save changes** button.

1. Mode of DoorPhone choice selects number per **Day/Night** DoorPhone mode or selects numbers of the first and second groups.
2. Sign for call extension * or # (10sec before call end the DoorPhone will send a notice, then the call may be extended)
3. Two commands in order to hang up the DoorPhone using both switches [2 digits]. The advantage is to set the same command both for switch closing and command to guard hanging up (page 32).
4. Command for **DAY / NIGHT** mode switching
Note: The switchover to Day/Night mode remains set in IPDP even after power supply disconnection.
5. Automatic or manual switching Day - Night mode. Automatic switch setting in "Day interface".
6. **Dialing as on normal telephone** (all number of called person should be pressed on keyboard). If use mode P2P then "." in IP address is made by push to button with "key"
Only 2-digit memory number is entered on keyboard by which the number of called person is stored (memory number corresponds to button number with respect to Day/Night switchover).
7. =0 only NC-module connected to the basic module
=1 not use
=2 the keyboard connected on the first position

=3 the keyboard connected on the second position (explanation of position keyboard is on chapter 1.4.7(page 16).

8. Default value – presettings to the firm settings. After making changes use the save changes button.

ATTENTION! This parameters setting will sharply influence whole DoorPhone function.

3.2.2 All about relays

Day mode

Menu:

- Network setting
- Basic parameters
- Setting audio
- Setting video
- **Relays** ✓
- Time parameters
- Memory numbers
- Service
- Video
- Help

Language:

english [v] [Set]

Relays:

Relay 1:

Relay mode: 1 ①

External code day + night: [] ②

External code day: []

External code night: []

Internal code from phone: 55 ③

Relay closing [sec]: 05 ④

Control of incoming call: ⑤

Relay 2:

Relay mode: 1

External code day + night: []

External code day: []

External code night: []

Internal code from phone: 66

Relay closing [sec]: 05

Control of incoming call:

Delay between 1 and 2 in mode 5: 10 ⑥

[default values] ⑦ [save changes]

After making changes use the **save changes** button.

1. Relay mode:

=1 **switch** mode – it will close on command or password for period **t1/2** (used for electrical locks, gate opening etc.)

=2 **camera** mode – it will close by guard pick up and open by hanging up.

=3 **lighting** mode – it will close by guard pick up and stay closed even for period **t1/2** after guard hanging up.

- =4 **bell mode** – it will close after button pressing and open after period **t1/2** (used for e.g. external bell or horn connections).
- =5 **gradual opening mode** – in this mode the only relay 2 will be set together with relay 1 set to mode 1. The relay 1 is activated for period **t1**, then the time **t3** is proceeding before relay 2 closing. Then the relay 2 is activated for **t2** period and afterwards the DoorPhone hangs up.
- Note: The only relay 1 can be activated from phone and all sequence started. Besides that the relay 2 can be separately activated from buttons by password.*
2. password for relay closing from buttons or keyboard [2 to 6 digits]. Total 6 passwords, they are controlled by Day/Night; the combination is entered either by DoorPhone buttons (first 1/2 buttons) or from attached keyboard (after pressing of key symbol). The relay closing influences the set switch **mode** and **Day/Night** switchover. By setting of choice mode of **2 number groups** the DoorPhone is permanently in **DAY** mode.
By password choice some rules have to be observed:
 - Select passwords in way not to find its combination out from wear of certain buttons by frequent use.
 - Select the first password button from frequentless button for direct dialing (-extends choice time)(-not valid for keyboard).
 - Pay attention to congruity of password numbers when one password includes other one, e.g. relay 1 has 1212 and relay 2 has 12121. Then after second pressing button 2 the only relay 1 is called, but password choice 212 for relay 2 can call both relays after second pressing button 2.
 3. Command from phone after relay closing [2 digits]. The same command can be set for both relays, then they are activated at the same time. The advantage is to set the same command both for relay closing and command to DoorPhone hanging up (page 31).
 4. Duration of relay closing in second [2 digits 01-99]
 5. To prohibit the control during incoming call is important e.g. when using relay 2 in mode 1 for control of garage gate opening, when the electronics opens the gate and the gate is closed by car passage. Then the control from phone could undesirably cause the permanent gate opening (not closed – no car passage).
 6. time in second between close relays 1 and 2 by mode setting of relay 2 is **5** (gradual opening) [2 digits 01-99]
 7. Default value – presetsings to the firm settings. After making changes use the save changes button.

3.2.3 Time Parameters

Day mode

Menu:

- Network setting
- Basic parameters
- Setting audio
- Setting video
- Relays
- Time parameters ✓
- Memory numbers
- Service
- Video
- Help

Language:

english [v] [Set]

Time parameters:

Maximum call duration [min]: ①

Numbers of rings: ②

Time between key presses [sec]: ③

Time hang up before redial [sec]: ④

Time before redial [sec]: ⑤

Audio signaling - opening/closing: ⑥

Audio signaling - others tones: ⑦

⑧

default values save changes

After making changes use the **save changes** button.

1. max. time, for which the DoorPhone is hanging up, this time can be extended during call by sign choice from telephone (* or #) – see page 31.
2. Number of incoming call rings, the DoorPhone pick up after presetted number of rings. After detection first ring – LED on front panel blinking. The number can be set from 1 to 9.
3. max. time [sec] among button presses [range 1-9]
switch closing – if time between two next presses is bigger than **w** time, the code is not evaluated correctly.
dialing – if the button, we are pressing, is the first password number for switch closing, so the choice is delayed by this **w** time.
4. time [sec] for which the guard will hang up, before repeated dialing (button pressing during call or dialing, busy tone detection) [range 1-5]
5. after finishing the dialing it calculates time (ringing tones). If the number exceeds time in second, it will hang up [range 10-99]. The dialing is repeated in case, when the dialing mode of 2 groups is set.
6. In default is status of DoorPhone signalling acoustically. If signalling makes problem, so this signalling pick up / hang up prohibited.
7. In default is status of DoorPhone signalling acoustically. If signalling makes problem, so this signalling others tones prohibited.
8. Default value – presettings to the firm settings. After making changes use the save changes button.

3.2.4 Direct Dialing – Memories

3

After making changes use the **save changes** button.

1. telephone number up to 16 digits, we want to store. The numbers are the numbers of the **first group** or numbers of **Day** mode. In default setting is table memoirs empty. While using setting P2P to the memoirs saves IP address e.g . 192*168*1*250, where „*“ means „.“ , while using SIP proxy server to the memoirs saves phone number e.g. 117.
2. telephone number up to 16 digits, we want to store. The numbers are the numbers of the **second group** or numbers of **Night** mode. In default setting is table memoirs empty. While using setting P2P to the memoirs saves IP address e.g . 192*168*1*250, where „*“ means „.“ , while using SIP proxy server to the memoirs saves phone number e.g . 117.

Note: The switchover to Day/Night mode remains set in DoorPhone even after power supply disconnection.

3. Default value – presetings to the firm settings. After making changes use the save changes button.

4 Technical Parameters

4.1 Electrical Parameters

| Parameter | Value | Conditions |
|--------------------------------|----------------------------------|-------------|
| Communication interface | Ethernet 10BaseT, 100BaseTx | |
| VoIP protocol supported | SIP | |
| Video | série JPEG, stream H.263 (H.264) | |
| Band width | 300Hz – 3400 Hz | |
| Power supply - adapter | 12Vss ± 2V , 12Vst ± 1V | |
| - or PoE | IEEE802,3af | Altern. A+B |
| Max. consumption | 300mA | 12Vss |
| Max. voltage of switch contact | 48V | at I < 1A |
| Max. current of switch contact | 2A | at U < 30 V |
| Operational temperature | - 20 to + 70°C | |

4.2 Mechanical dimensions

| Panel | Flush mounted installation box | Surface mounted installation box | Weater protection hoods |
|--|--------------------------------|----------------------------------|----------------------------|
| valid for dimensions of all ref numbers of all panels with height 1 (series 1) | ref. F08843 | ref. F7061 | for one panel – ref. F8400 |
| 130(w)x128(h) | 115(w)x114(h)x45(d) | 130(w)x114(h)x33(d) | 135(w)x130(h) |
| | | | for two panels – ref. 8408 |
| | | | 265(w)x130(d) |

4.3 Parameters of video

Video for WEB:

InternetExplorer - (series JPEG pictures) is using again and again repeated http request ADDRESS/video.jpg

Mozilla, Opera, Firefox ... and program **PopUp** (UDVguard) - (MJPEG stream) is using http request ADDRESS/video.mjpg (sometimes it is necessary reload beyond with it start). This video is continuously and has smaller load of nets.

Stream video for IP phones:

H.263 IPDP doorphone and videophone communicate over SIP/SDP protocol on standard SIP port and video (and sound) then run in RTP protocol on port talk to SIP.

Guarantee conditions:

The product was shop-checked. The producer guarantees that this product will keep the features described in these operating instructions in the course of guarantee provided that the user will be handled with it as described in the operating manual. The guarantee will be extended by period of possible guarantee repair.

When claiming in guarantee period please contact your dealer. The producer only will make the guarantee repairs. Attach the description of claim reason, proof of purchase and your exact address to the product.

The guarantee does not include:

- mechanical, thermal, chemical and other damages caused by user's activities
- defects caused by natural disasters
- defects caused by repair or changes carried out by user or other unauthorized person
- willful damage of product
- incorrect use of product caused by other use than specified in operating manual (e.g. installation, programming)
- damages caused during product transport to customer and from supplier
