INTRODUCTION

Asterisk Manager Interface (AMI) allows a client program to connect to an Asterisk instance and issue commands or read events over a TCP/IP stream. This is particularly useful when the integrators try to track the state of a telephony client inside Asterisk.

A simple "key: value" line-based protocol is utilized for communication between the connecting client and the Asterisk PBX. Lines are terminated by using CR/LF. In this document, we will use the term "packet" to describe a set of "key: value" lines that are terminated by an extra CR/LF.

Some useful Asterisk Manager Interface information can be found in the following links:

http://www.voip-info.org/wiki/view/Asterisk+manager+API https://wiki.asterisk.org/wiki/pages/viewpage.action?pageId=4817239

The UCM6XXX provides restricted AMI access for users. In order to connect to Asterisk Manager Interface on UCM6XXX, please follow the steps below.

- 1. Create new AMI user.
- 2. Configure AMI ports for connection.
- 3. Establish connection and authenticate the user.

This document introduces each step and necessary configurations in the following sections.

Note: UCM6XXX series include UCM6100 series (UCM6102, UCM6104, UCM6108 and UCM6116), UCM6200 series (UCM6202, UCM6204 and UCM6208) and UCM6510.

Marning:

Please do not enable AMI on the UCM6XXX if it is placed on a public or untrusted network unless you have taken steps to protect the device from unauthorized access. It is crucial to understand that AMI access can allow AMI user to originate calls and the data exchanged via AMI is often very sensitive and private for your UCM6XXX system. Please be cautious when enabling AMI access on the UCM6XXX and restrict the permission granted to the AMI user. By using AMI on UCM6XXX you agree you understand and acknowledge the risks associated with this.

CREATING NEW AMI USER

- 1. Log in the UCM6XXX web UI and navigate to PBX->Internal Options->AMI.
- 2. Click on "Create New AMI User".

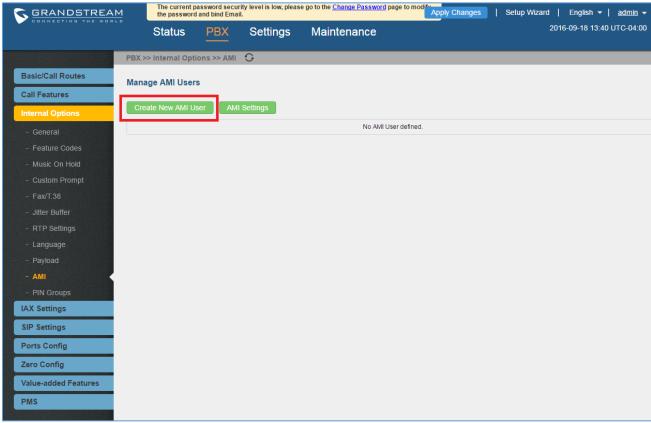

Figure 1: Web UI->Internal Options->AMI

3. A new dialog "Create New AMI User" will be prompted.

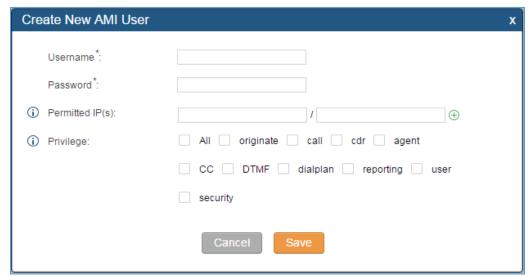

Figure 2: Create New AMI User Dialog

4. Configure the following parameters in the "Create New AMI User" dialog:

Username

Configure a name for new AMI user. The username needs to be at least 8 characters. For example, ucmamiuser1.

Password

Configure a password for this user to connect to AMI for authentication purpose. The password has the following requirement:

- at least 6 characters
- must contain numeric digit
- at least one lowercase alphabet, or one uppercase alphabet, or one special character

• Permitted IP(s)

Configure an IP address Access Control List (ACL) for addresses that should be allowed to authenticate as the AMI user. <u>If not set, all IPs will be denied.</u> The format is IP/subnet. For example, 192.168.40.144/255.255.255.255.

Privilege

Configure the privilege for the AMI user. Please see options and definitions in below table.

Table 1: AMI User Privilege

Privilege Option	Definition
All	This provides all privilege options to user.
originate	Write-only. It provides permission to originate new calls.
call	It provides permission to access information about channels and ability to configure in a running channel.
cdr	Read-only. This provides permission to obtain output of cdr-manager, if loaded.
agent	This provides permission to access call queue information and agents' information. It also provides ability to add members to a call queue.
CC	Read-only. This provides permission to receive Call Completion events.
DTMF	Read-only. This provides permission to receive DTMF events.
dialplan	Read-only. This provides permission to receive NewExten and VarSet events.
reporting	This provides ability to obtain statistics and status information from the system.
user	This provides permission to send and receive UserEvent.
security	Read-only. It provides ability to read security events.

5. Click on "Save" and then "Apply Changes".

Figure 3: AMI User Created

Now the AMI user is successfully created. After creating the AMI user, it can be edited by clicking on icon or deleted by clicking on icon.

CONFIGURING AMI PORTS

1. In UCM6XXX web UI->PBX->Internal Options->AMI page, click on "AMI Settings".

Figure 4: AMI Settings

2. A new dialog "AMI Settings" will be prompted.

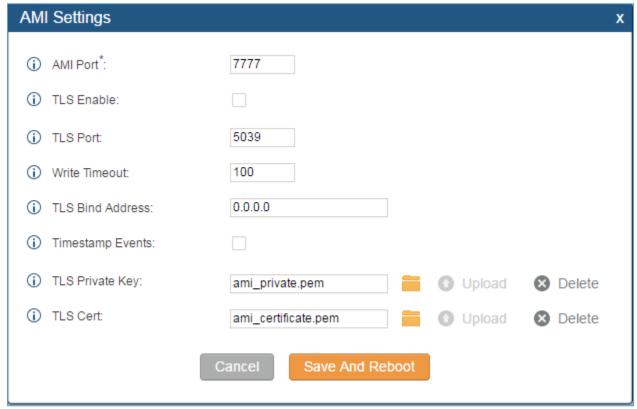

Figure 5: AMI Settings Dialog

3. Configure the following parameters in "AMI Settings" dialog. Users can connect AMI using TCP or TLS. If using TLS, please set "TLS Enable" to "Yes".

Table 2: AMI Settings Parameters

Parameter	Definition
AMI Port	Configures the port number to listen to for AMI connection. The default setting is 7777.
TLS Enable	Enables listening for AMI connections using TLS. The default setting is No.
TLS Port	Configures the port to listen to for TLS-based AMI connection. The default setting is 5039.
Write Timeout	Sets the timeout when writing data to the AMI connection for this user. This option is specified in milliseconds. The default value is 100.
TLS Bind Address	Configures the address to listen to for TLS-based AMI connections. The default setting is 0.0.0.0, which means all addresses.
Timestamp Events	Add a Unix epoch timestamp to events.
TLS Private Key	Upload TLS private key for TLS-based AMI connection. The size of the key file must be under 2 MB. After uploading, the file will be automatically renamed to "ami_private.pem".
TLS Cert	Upload the TLS cert for TLS-based AMI connection. It contains private key for the client and signed certificate for the server. The size of the certificate must be under 2MB. After uploading, the file will be automatically renamed to "ami_certificate.pem".

4. Click on "Save" and then "Apply Changes" to save the AMI settings.

ESTABLISHING CONNECTION AND USER AUTHENTICATION

- 1. To connect AMI using TCP, simply use Telnet to connect to UCM6XXX's IP address with AMI port.
 - If using command line, users can type in: telnet 192.168.40.237 7777
 - If using PuTTY, users might need change the Telnet setting "Telnet Negotiation Mode" to "Passive" first. Then initiate Telnet connection to AMI from Putty.

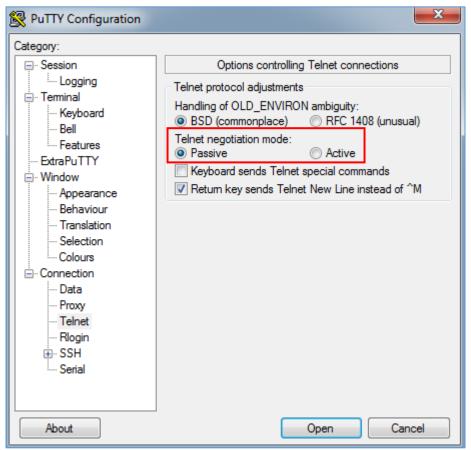

Figure 6: Telnet Settings in PuTTY

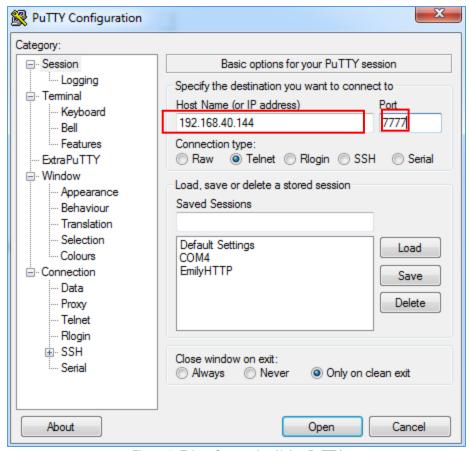

Figure 7: Telnet Connection Using PuTTY

2. After initiating connection, users shall see prompt like below, meaning connection is established.

```
Asterisk Call Manager/2.7.0
```

Figure 8: Telnet Connection to AMI Using TCP

3. To connect AMI using TLS, use the following format to connect the TLS port in command line:

```
root@ubuntu:~# telnet –z ssl –z cert=certificate.pem –z key=private.pem 172.16.0
.73 5039
Trying 172.16.0.73...
SSL: Server has a self–signed certificate
SSL: unknown issuer: /C=US/ST=TX/L=Plano/O=Grandstream/OU=Dev/CN=Philip Newman/e
mailAddress=pnewman@grandstream.com
Connected to 172.16.0.73.
Escape character is '^]'.
```

Figure 9: Telnet Connection to AMI Using TLS

The IP address is the UCM6XXX IP and 5039 is the TLS port.

4. After the connection is established, the system will wait for user's input. By default, if there is no input in 30 seconds, the system will disconnect automatically.

5. To log in and get authenticated, manually enter all the text below:

action: login

username: ucmamiuser1

secret: test123

Tap on ENTER and users should see response like below. Sometimes if there is no response after ENTER, please tap on ENTER again.

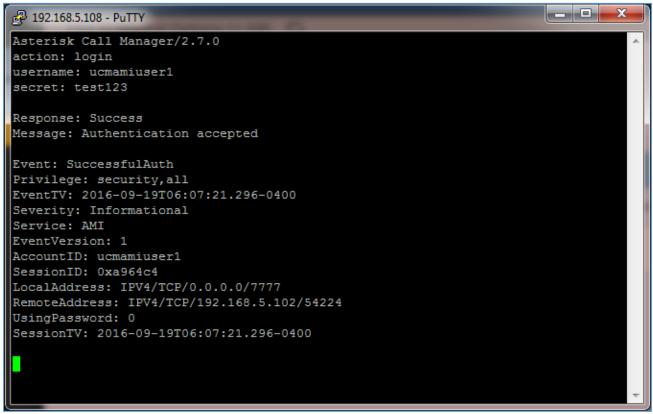

Figure 10: User Authentication Successful

Note: Users must log in and get authenticated before using other commands.

6. To view all executable AMI command, enter text below:

action: listcommands

Tap on ENTER. Users will see the following output. (Sometimes if there is no response after ENTER, please tap on ENTER again.)

```
_ D X
192.168.5.108 - PuTTY
action: listcommands
Response: Success
AbsoluteTimeout: Set absolute timeout. (Priv: system, call, all)
AnalogChanlists: (Priv: <none>)
Atxfer: Attended transfer. (Priv: call,all)
BlindTransfer: Blind transfer channel(s) to the given destination (Priv: call,a
11)
Bridge: Bridge two channels already in the PBX. (Priv: call, all)
BridgeDestroy: Destroy a bridge. (Priv: <none>)
BridgeInfo: Get information about a bridge. (Priv: <none>)
BridgeKick: Kick a channel from a bridge. (Priv: <none>)
BridgeList: Get a list of bridges in the system. (Priv: <none>)
BridgeTechnologyList: List available bridging technologies and their statuses.
(Priv: <none>)
BridgeTechnologySuspend: Suspend a bridging technology. (Priv: <none>)
BridgeTechnologyUnsuspend: Unsuspend a bridging technology. (Priv: <none>)
Challenge: Generate Challenge for MD5 Auth. (Priv: <none>)
ChangeMonitor: Change monitoring filename of a channel. (Priv: call, all)
ConfbridgeKick: Kick a Confbridge user. (Priv: call, all)
ConfbridgeList: List participants in a conference. (Priv: reporting,all)
ConfbridgeListRooms: List active conferences. (Priv: reporting,all)
ConfbridgeLock: Lock a Confbridge conference. (Priv: call,all)
ConfbridgeMute: Mute a Confbridge user. (Priv: call, all)
ConfbridgeSetSingleVideoSrc: Set a conference user as the single video source di
stributed to all other participants. (Priv: call, all)
ConfbridgeStopRecord: Stop recording a Confbridge conference. (Priv: call,all)
ConfbridgeUnlock: Unlock a Confbridge conference. (Priv: call,all)
ConfbridgeUnmute: Unmute a Confbridge user. (Priv: call, all)
ControlPlayback: Control the playback of a file being played to a channel. (Pri
v: call,all)
CoreCheckChannel: (Priv: system, reporting, all)
CoreSettings: Show PBX core settings (version etc). (Priv: system,reporting,all
CoreShowChannels: List currently active channels. (Priv: system, reporting, all)
CoreStatus: Show PBX core status variables. (Priv: system,reporting,all)
DAHDIDialOffhook: Dial over DAHDI channel while offhook. (Priv: <none>)
DAHDIDNDoff: Toggle DAHDI channel Do Not Disturb status OFF. (Priv: <none>)
DAHDIDNDon: Toggle DAHDI channel Do Not Disturb status ON. (Priv: <none>)
DAHDIHangup: Hangup DAHDI Channel. (Priv: <none>)
DAHDIRestart: Fully Restart DAHDI channels (terminates calls). (Priv: <none>)
DAHDIShowChannels: Show status of DAHDI channels. (Priv: <none>)
DAHDITransfer: Transfer DAHDI Channel. (Priv: <none>)
DataGet: Retrieve the data api tree. (Priv: <none>)
DBGet: Get DB Entry. (Priv: system, reporting, all)
DeviceStateList: List the current known device states. (Priv: call, reporting, al
```

Figure 11: AMI Command Example

EXAMPLES

There are mainly 3 types of AMI packets:

- Action: packets sent by client to Asterisk to request to perform a particular action. There are a limited
 number of actions for the client to use and each of them is decided by the module in Asterisk server. Only
 one action can be performed each time and the action packet contains the action name and parameters.
- **Response**: response by Asterisk to the client action.
- Event: information about the events of Asterisk core or expansion modules.

Note: Please make sure the AMI user is logged in and authenticated first

Example 1: Originate an internal call

```
action: Originate
Channel: PJSIP/1000
Context: from-internal
Exten: 1001
Priority: 1
Timeout: 60000
```

Figure 12: Example 1 - Originate Internal Call Ext 1000 to Ext 1001

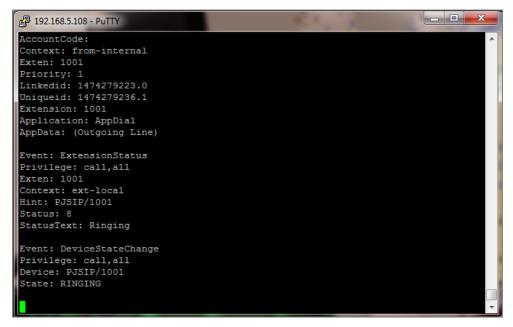

Figure 13: Example 1 - Ext 1001 Ringing

Example 2: Originate an external call via trunk

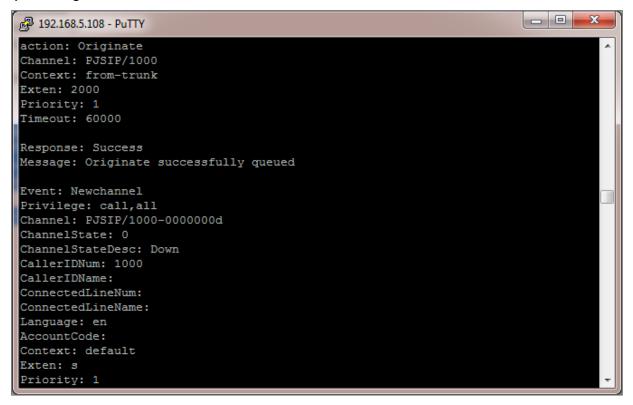

Figure 14: Example 2 - Originate External Call

Example 3: Channel hang-up

Note: This command will hang up active call.

Figure 15: Example 3 - Channel Hangup

Example 4: Query the status of queue

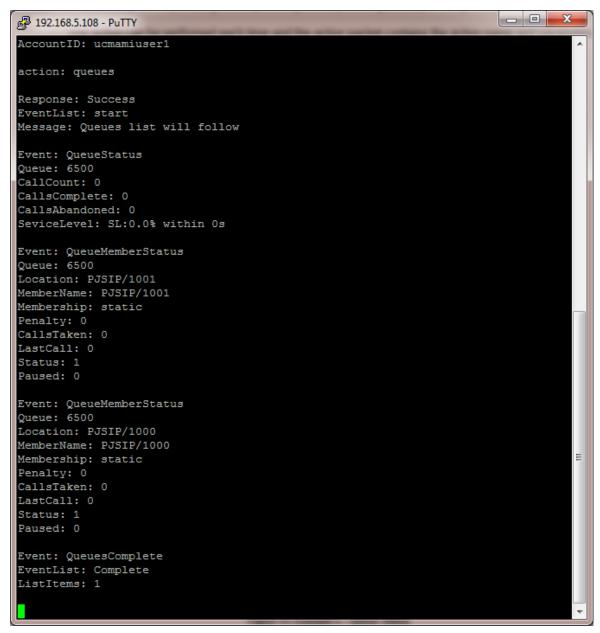

Figure 16: Example 4 - Queue Status
